

has

CORN

helped your

EARTH

today?

Corn has many uses, but did you know CORN is a renewable resource that helps the environment?

HERE'S HOW!!

FUEL: CORN is used to make ethanol, a clean-burning fuel that keeps our air cleaner. Ethanol is renewable because it is made from corn and other grains. Our farmers can grow plenty of corn for food and fuel!

PLASTICS: Plastic trash bags, disposable forks, spoons and plates can all be made from CORN-based plastics. Because they are made from CORN, they are renewable and biodegradable!

Grain sorghum
farmers

Care

for the

EARTH

Farmers who grow grain sorghum work with the soil, water and air to produce their crops. That's why they work so hard to care for the earth!

Farmers sometimes use small amounts of weed and bug killers, these are like medicines to keep the crops healthy. Fertilizers are like vitamins to make their crops healthy and strong.

Farmers are careful to make sure their crop's medicines and vitamins stay in the field where they belong. Farmers love the land. After all, it's where they raise their crops and their families!
